

Table 1: Sorted list by frequency of the transitions used to analyse the detected molecules in this work. These transitions were employed in the MADCUBA fitting to derive their physical parameters (Table 3). Frequency shows the rest frequency of the transitions in GHz. Transition lists the upper and lower energy levels involved in each transition. The log I is the logarithm of the line intensity in nm² MHz; E_{up} is the energy of higher level in K, and τ is the optical depth of the transitions.

Frequency (GHz)	Species	Transition	log I (nm ² MHz)	E_{up} (K)	$\tau(\times 10^{-2})$
